

Since our last meeting, we have worked to complete the Minimal Viable Product.

Achieved Milestones

- Created a way to propagate events to the map and display them as pins (sorted by location)
- Finished connecting backend to frontend
- Completed login, logout, navigation bar
- Users are able to create, edit, delete events
- Started filtering functionality - currently filtering by events happening now

Identify difficulties encountered

- ` is different than `
- When refreshing or going to page directly through URL, sometimes no Bootstrap formatting
- Problems creating documents because passing in wrong parameters
- Datpicker
