All Introduced ourselves
R Review of our progress, discussed the React learning curve
R Generally on good track to complete our MVP
E Discussed change in our location data model
D Events have optional room number
V Room number is not tied to location, it is tied to event
D Date picker vs time picker problem
V MVP doesn't need to deal with all edge cases or have to look particularly nice, but make sure it doesn't crash for all not-nice inputs
D Client routes were getting mixed up with request routes
V Best practices - POST to /[name of resource]
All Clarification of issue
V /new might help
V In Express, the most specific route is not the one that is matched, it is the first route that gets matched
V Put the create form path first in eventServices
E How will moving the order of the path change the problem of getting confused with the backend routing?
V On the client you don't have to use RESTful routes. For now, rename them, and then I will do more research on it
R Question about passing state
V Maybe unknown property error means that property is not getting set. If the new state depends on the old state, make sure you're writing a function to pass the old state properties to the new state, instead of completely overwriting the old state.
R Maybe the API we are using requires something we are not providing
V The map API might need to know about what container it is in. Look into the API documentation
